Running RevenueArchitect — Step by Step

This is a **full-stack app** with two parts: a **FastAPI backend** and a **React/Vite frontend**. You need two terminals running simultaneously.

✅ Prerequisites Check

Make sure you have these installed:

- **Python 3.11+** — `python --version`
- **Node.js 18+** — `node --version`
- **npm** — `npm --version`

🔧 Terminal 1 — Backend (FastAPI)

powershell
```
# 1. Navigate to the backend
cd "c:\Users\GODDY\Documents\PROJECTS\Saas Products\Shopify\backend"
# 2. Activate the virtual environment (already created)
.venv\Scripts\Activate.ps1
# 3. Install dependencies (only needed once)
pip install -r requirements.txt
# 4. Start the FastAPI server
uvicorn app.main:app --reload --port 8000
```
✅ Backend is ready when you see: `Uvicorn running on http://127.0.0.1:8000`
□ Verify it works: open http://localhost:8000/health — should return `{"ok": true}`
📖 API docs auto-generated at: http://localhost:8000/docs

🚀 Terminal 2 — Frontend (React/Vite)

powershell
```
# 1. Navigate to the frontend
cd "c:\Users\GODDY\Documents\PROJECTS\Saas Products\Shopify\frontend"
# 2. Install dependencies (only needed once, node_modules already exists)
npm install
# 3. Start the dev server
npm run dev
```
✅ Frontend is ready when you see: `Local: http://localhost:5173`
🌐 Open http://localhost:5173 in your browser

⚠ Important Notes

Issue	Fix
`.venv\Scripts\Activate.ps1` blocked	Run: `Set-ExecutionPolicy -Scope CurrentUser RemoteSigned` first
`psycopg2` install fails	Install the binary: `pip install psycopg2-binary` instead
Port 8000 already in use	Kill it: `netstat -ano | findstr :8000` then `taskkill /PID <id> /F`
Frontend can't reach backend	Confirm `VITE_API_URL=http://localhost:8000` is in `frontend/.env` ✅

🗄️ Database

Your Supabase credentials are **already configured** in `backend/.env` — no extra DB setup needed. The app connects directly to your hosted Supabase Postgres instance.

TL;DR: Activate venv → `uvicorn app.main:app --reload` in one terminal, `npm run dev` in another. Done.
